

Are you wondering what to do with an aging information system and your organization has a small appetite to engage in IT strategic planning?

The target users for the IT Plan in a Box are hospital-based IDN's, that have an aging product not suited to the integrated single platform model as their primary software. Recent Attorney General dispositions on limiting acquisitions by large health systems create a turning point where many of these provider organizations are determining their paths as independent organizations and/or seeking other affiliation alternatives. These organizational strategies directly affect the IT strategy and raise options, such as:

- Whether to upgrade your aging system to a newer version of your current vendor's product
- Switch to another system and leverage the functionality of a different vendor
- Explore other joint venture or service delivery models

STEP #1
Self-Survey

HealthNET has developed an on-line survey that covers the essential elements of IT planning, including:

- Baseline IT facts
- Organizational goals/objectives
- Key stakeholder input for needs, timing and priorities

STEP #2
Review

It's like interpreting a radiology image. The survey results are compiled and analyzed by HealthNET's IT strategic experts. We will interpret and analyze the facts and input, and then:

- Summarize needs and priorities
- Develop IT strategies and tactics
- Relate these strategies to overall business goals/objectives
